Analytics Rx Introduces Behavioral Health Analytics Software
Features first real-time dashboards using Qualifacts VJDBC 6.1 data connection
Increases behavioral health providers' bottom lines up to 30 percent per program

FORT WORTH, Texas, June 5, 2017 – Analytics Rx, a Pittsburgh-based software developer, has released its latest version of *Analytics Rx* software for behavioral health providers at the 2017 Carelogic Community Users Conference. Carelogic, developed by Nashville-based Qualifacts, is a web-based electronic health record (EHR) designed specifically for behavioral health and human services organizations. *Analytics Rx* software integrates providers' general ledger and other data infrastructures with EHRs, such as Qualifacts' Carelogic, into a HIPAA-compliant, cloud-based business solution. *Analytics Rx* software enables organizations to use real-time analytics to improve compliance, outcomes and productivity without the delays of having to manually create the information.

The newest feature is a Virtual JDBC (VJDBC) 6.1 data connection. *Analytics Rx* provides a secure VJDBC, which is a JDBC type-3 driver that offers a client-server model for remote access of JDBC data sources over different network protocols. This connection integrates and compiles data into real-time outcome, productivity and compliance dashboards. Dashboard graphics display tactical information in charts, graphs and gauges, providing an agency's management with organizational transparency and evidenced-based leadership tools that drive performance.

Since its introduction in 2013, *Analytics Rx* software has added an average of 15 percent to 30 percent to behavioral health providers' bottom lines per program. According to Scott Douglass, director of quality, at Pittsburgh-based Milestone Centers, Inc., which offers direct care services to 2,700 persons annually in Allegheny and Westmoreland counties in Pennsylvania, "After a small sample, we're projecting that Analytics Rx dashboards, accompanied with improved scheduling, will reduce our outpatient losses by 24 percent.

(more)

"In this compliance-driven, pay-for-performance and regulatory environment, behavioral health providers need a trusted ally like *Analytics Rx*," Douglass added.

Analytics Rx software was created by Steve Blaney, a former management consultant with Westinghouse Productivity Center, and is based on his collaborations with for- and non-profit organizations over more than 35 years. *Analytics Rx*'s other software solutions include *Performance Manager* and *Outcome Evaluator*, which are sold as standalone products or as an integrated suite. The company also offers 24/7 support and training, and provides consulting through its sister company, Performance Associates International. Analytics Rx has secured nearly $1 million in grants to help behavioral health organizations purchase its products. Its *Peer-to-Peer Analytics* software solution, enabling behavioral health providers to compare performance and share best practices, is targeted for release in 2018. Analytics Rx and Performance Associates International are based in Pittsburgh.
